WHAT IS CLAIMED IS:

 A computer readable medium containing a computer program for representing an electronic circuit, which has been segmented into plurality blocks, as a routing-resource graph, which comprises:

a first wiring data structure with first switch information and a first wire identity information to identify a first wire across a first plurality of blocks;

a second wiring data structure with the first switch information and a second wire identity information to identify a second wire across a second plurality of blocks; and

a first switch data structure having wire information and associated with the first and second wiring data structures for identifying a third wire connected to the first wire with a switch as a function of the first wire identity information and wire information from the first switch data structure.

- 2. The computer readable medium according to claim 1, wherein the first switch data structure can identify a fourth wire connected to the second wire with another switch as a function of the second wire identity information and wire information from the first switch data structure.
- 3. The computer readable medium according to claim 1, wherein the wire information is a first local wire name of the first wire and a second local wire name of the third wire in a block where the switch connects the first and third wires.

- 4. The computer readable medium according to claim 1, wherein the switch information is an array of switch data structures representing switches that the first wire and second wire drive.
- 5. The computer readable medium according to claim 4, wherein the array of switch data structures represents a first plurality of switches at relative locations along the first wire within a first plurality of blocks and a second plurality of switches at relative locations along the second wire within a second plurality of blocks.
- The computer readable medium according to claim 1, wherein the first switch data structure includes a method call to determine a pointer to the second wire.
- A method for representing an electronic circuit as a routing-resource graph comprising:
- defining a plurality of blocks each having a regular sub-array of switches and wires;
- defining a first wiring data structure with first switch information and first wire identity information to identify a first wire;
- defining a second wiring data structure with first switch information and second wire identity information to identify a second wire; and

defining a first switch data structure associated with the first and second wiring data structures for identifying wires respectively connected to the first and second wires by a switch as a function of wire identity information and wire information from the first switch data structure.

8. The method of claim 7 comprising:

identifying a switch at a relative location along a first wire within a plurality of first blocks; and identifying another switch at the relative location along a second wire within a second plurality of blocks.
